

Product Due Diligence - Scope of Work

In scope areas – Product Due Diligence

(1/2)

SN	Objective	Scope of Work
1	Review product tech stack and architecture for scalability constraints	Review technology stack to identify limiting factors for growth, including core architecture, use of legacy languages/ frameworks, interfaces etc. Identify any legacy systems, degree of tech standardization etc.
2	Technology readiness to support future business growth projections	Review technology platform roadmap and operating model to identify whether adequate planning and resources are available to meet business objectives.
3	Review product infrastructure to understand scalability constraints	Review scalability of infrastructure to meet deal thesis, including use of cloud services, infrastructure management, performance/ scalability testing performed, and backup/ DR cadence
4	Review risks related to cyber security posture, and internal IT governance to manage security and privacy	Review IT governance and security framework and testing results (strategy/ policy, governance structure, solutions implemented and managed, testing performed etc.) and initiatives implemented for cybersecurity and data privacy
5	IT Regulatory aspects	Gain overview of SAR audit report, as well as identify any additional tech related regulatory requirements
6	Technology team	Understand current capacity and capabilities for the Product tech team, and identify limiting factors from a growth perspective (ex. key personnel, spread of knowledge)
7	Current IT stack is adequately integrated across internal components and third-party solutions in an automated manner	Review key functionalities in the system and readiness for IT enabled integration across technology platform landscape

In scope areas – Product Due Diligence

(2/2)

SN	Objective	Scope of Work
8	Software development lifecycle (SDLC)	Review development and testing methodology, quality metrics, release cadence, Devops capabilities and other associated areas
9	Technology vendors	Identify major vendors and their role in Tech stack, as well as Tech stack focused on specific clients. Identify accountability and obligations due to tech failure, as well as tenure of contracts and monetary spends obligations due to Tech.
10	Tech outages and disclosures	Identify any outages, vulnerabilities and other relevant aspects etc. basis disclosures made

Enterprise IT Due Diligence - Scope of Work

In scope areas – Enterprise IT due

diligence (1/2)

Focus Area	Key considerations
Applications	• Assess key enterprise IT applications, such as ERP, CRM, timesheet system, HRMS, finance and accounting systems (AR, AP, FA, GR etc.) etc. and level of automation enabled for supporting business processes • Assess IT infrastructure for enterprise IT applications (on cloud and on premise), reviewing end of life assets as well as ability to support planned growth • Assess list of all the dashboards (Finance, Processes, infrastructure and others) along with the functionalities and KPI including employee productivity
IT Strategy and Roadmap	• Review enterprise IT roadmap prepared by management, fitment to meet business objectives, and current level of preparedness for the roadmap initiatives
IT Org and Governance	• Review IT organization including key personnel, responsibilities, skills and areas of specialist knowledge, including any key person risk
IT Infrastructure	• Overview of the infrastructure (on-premise/ cloud) and services including Infra architecture diagram showing the linkage between various infra components, example servers, devices, storage, backup, analytics, availability zones and instances etc. • Assess details of data centers • Review implementation of backup, disaster recovery and restoration policy • Review infrastructure performance metrics are monitored (CPU, disk space, RAM) to allow monitoring of the application performance KPIs, and the processes/mechanisms in place to ensure the infrastructure is scalable and can meet planned business growth • Assess the status EOL infrastructure
IT Financials	• Evaluate IT financials and details of how the technology budget is defined and agreed.

In scope areas – Enterprise IT due

Focus Area	Key considerations
IT Projects	• Review in-flight enterprise projects' status and management's plan for completion of such projects • Assess all ongoing enterprise IT projects, corresponding budget, resource mapping, current status and estimated date of completion of each project
Software Development Lifecycle for internal apps	• Review key SDLC (Software Development Life Cycle) applications being leveraged, such as bug management, project management system, knowledge management platform, collaboration and communication platform etc. for custom developed internal applications • Review SDLC for product development cycle and digital technology • Review software development processes from requirements definition, through to development, integration, testing and deployment
Emerging Tech	• Overview of Emerging Technologies such as Analytics, RPA, AI, ML related solutions that have been implemented for enabling key business processes.
Contracts and Licenses	• Review and Assess of key IT contracts & licenses

Thank you
